

PSEUDO METAL ZONE V1

Dual-stage RC4558 distortion pedal using single-supply (+9V) operation and VREF biasing.

Architecture:
Input → Gain Stage A → Interstage Filter → Gain Stage B → Asymmetrical Clipping → Anti-Fizz Filter → Master Volume → Output

The first stage provides initial amplification. The second stage generates most of the gain. Asymmetrical diode clipping creates harmonic distortion. The anti-fizz network reduces excessive high frequencies.

Designed as a mod-friendly platform with exposed test points and PCB jumpers for experimentation.
